

## Vetasi Oil and Gas Accelerator

### Best practice solutions

Our standard build for an Oil and Gas installation would typically include the Maximo Oil and Gas solution, Vetasi Manifesting Application, ISO 14224 Asset classifications and failure codes and a set of standard business processes. We would anticipate integrations to Primavera and the client's ERP solution (Oracle eBusiness Suite, Sun Systems or SAP financials).

### Process

Rather than starting with a blank whiteboard, our consultants present a best practice for the specific process, adjusting it to meet any specific customer requirements. Vetasi's Oil and Gas Accelerators include a suite of standard processes and workflows configured for both upstream and downstream Oil and Gas companies.

### Data Standards

The ISO 114224 standard is designed specifically for Oil and Gas companies. In addition, Vetasi offers uploadable libraries for Assets, Failure Codes and Inventory Classifications.

### Add on solutions

Our template solutions for common requirements in the offshore industry includes the Vetasi Manifesting Module built in 2010 which has been continuously upgraded to the current Maximo 7.6.1 release.
