

VETASI SELECTS MAXTAF FOR AUTOMATED MAXIMO TESTING

Asset and maintenance management experts Vetasi have teamed up with Code Development, the creators of leading technology for the testing of Maximo EAM, after selecting MaxTAF as its strategic Quality Assurance technology.

“Our goal is to perform full regression testing every single day, across all of our active projects. We simply can't do that without automation.” said James Prior, Managing Director of Vetasi.

Frank Baker, Services Director at Vetasi, adds: “With the intensity and repeatability of testing that we can achieve with this IBM certified technology, our clients can rest assured that there will be no surprises at the point of UAT.

“Any defects in the system caused by regression will be discovered early, well ahead of UAT, and will be corrected immediately with minimal knock-on effect. The time and cost saving benefits achieved on our first project using MaxTAF to its full potential were clear to see and easily quantifiable.”

Dusko Delic, the founder of Code Development, says the technology is game changing for Maximo EAM projects: “Companies like Vetasi are showing how Maximo will be implemented in the future. The days of waterfall methodology and the specify-develop-test-deliver phasing of projects are numbered. Modern corporates demand much more flexibility and that can only be achieved with an agile approach, which in turn mandates automated testing.”
